230 ‘Out of Control’ Adolescent

231 Self-Assessment

Discussion of some of the questions follows:

(2) D. Usually patients with Turner syndrome have primary amenorrhea, but rarely patients may have a few primordial follicles or mosaicism, which leads to a few scant menstrual periods

(3) A. Dilation and curettage may occasionally be required for therapy but is not the first choice. D. Enovid is an oral contraceptive.

(4) Pediatricians should be able to treat this common adolescent problem, but as with other medical problems, an examination should precede therapy. B. Salicylates are prostaglandin inhibitors and are probably the first drug to be used; to be most effective salicylates should be started two to three days prior to expected onset of menses.
